Arpit Srivastava

Worked with : CertiK, Polygon

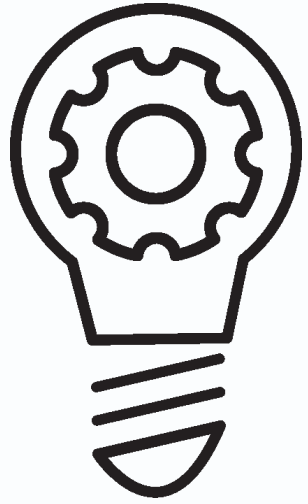

# The Idea

- Newbie users find it difficult to interact with Defi due to wallet custody
- Newbie users don't know mostly where to swap, how to swap/ perps etc.
- Users don't have an easy non-custodial way to place limit orders
- No protection against depegs/price fall

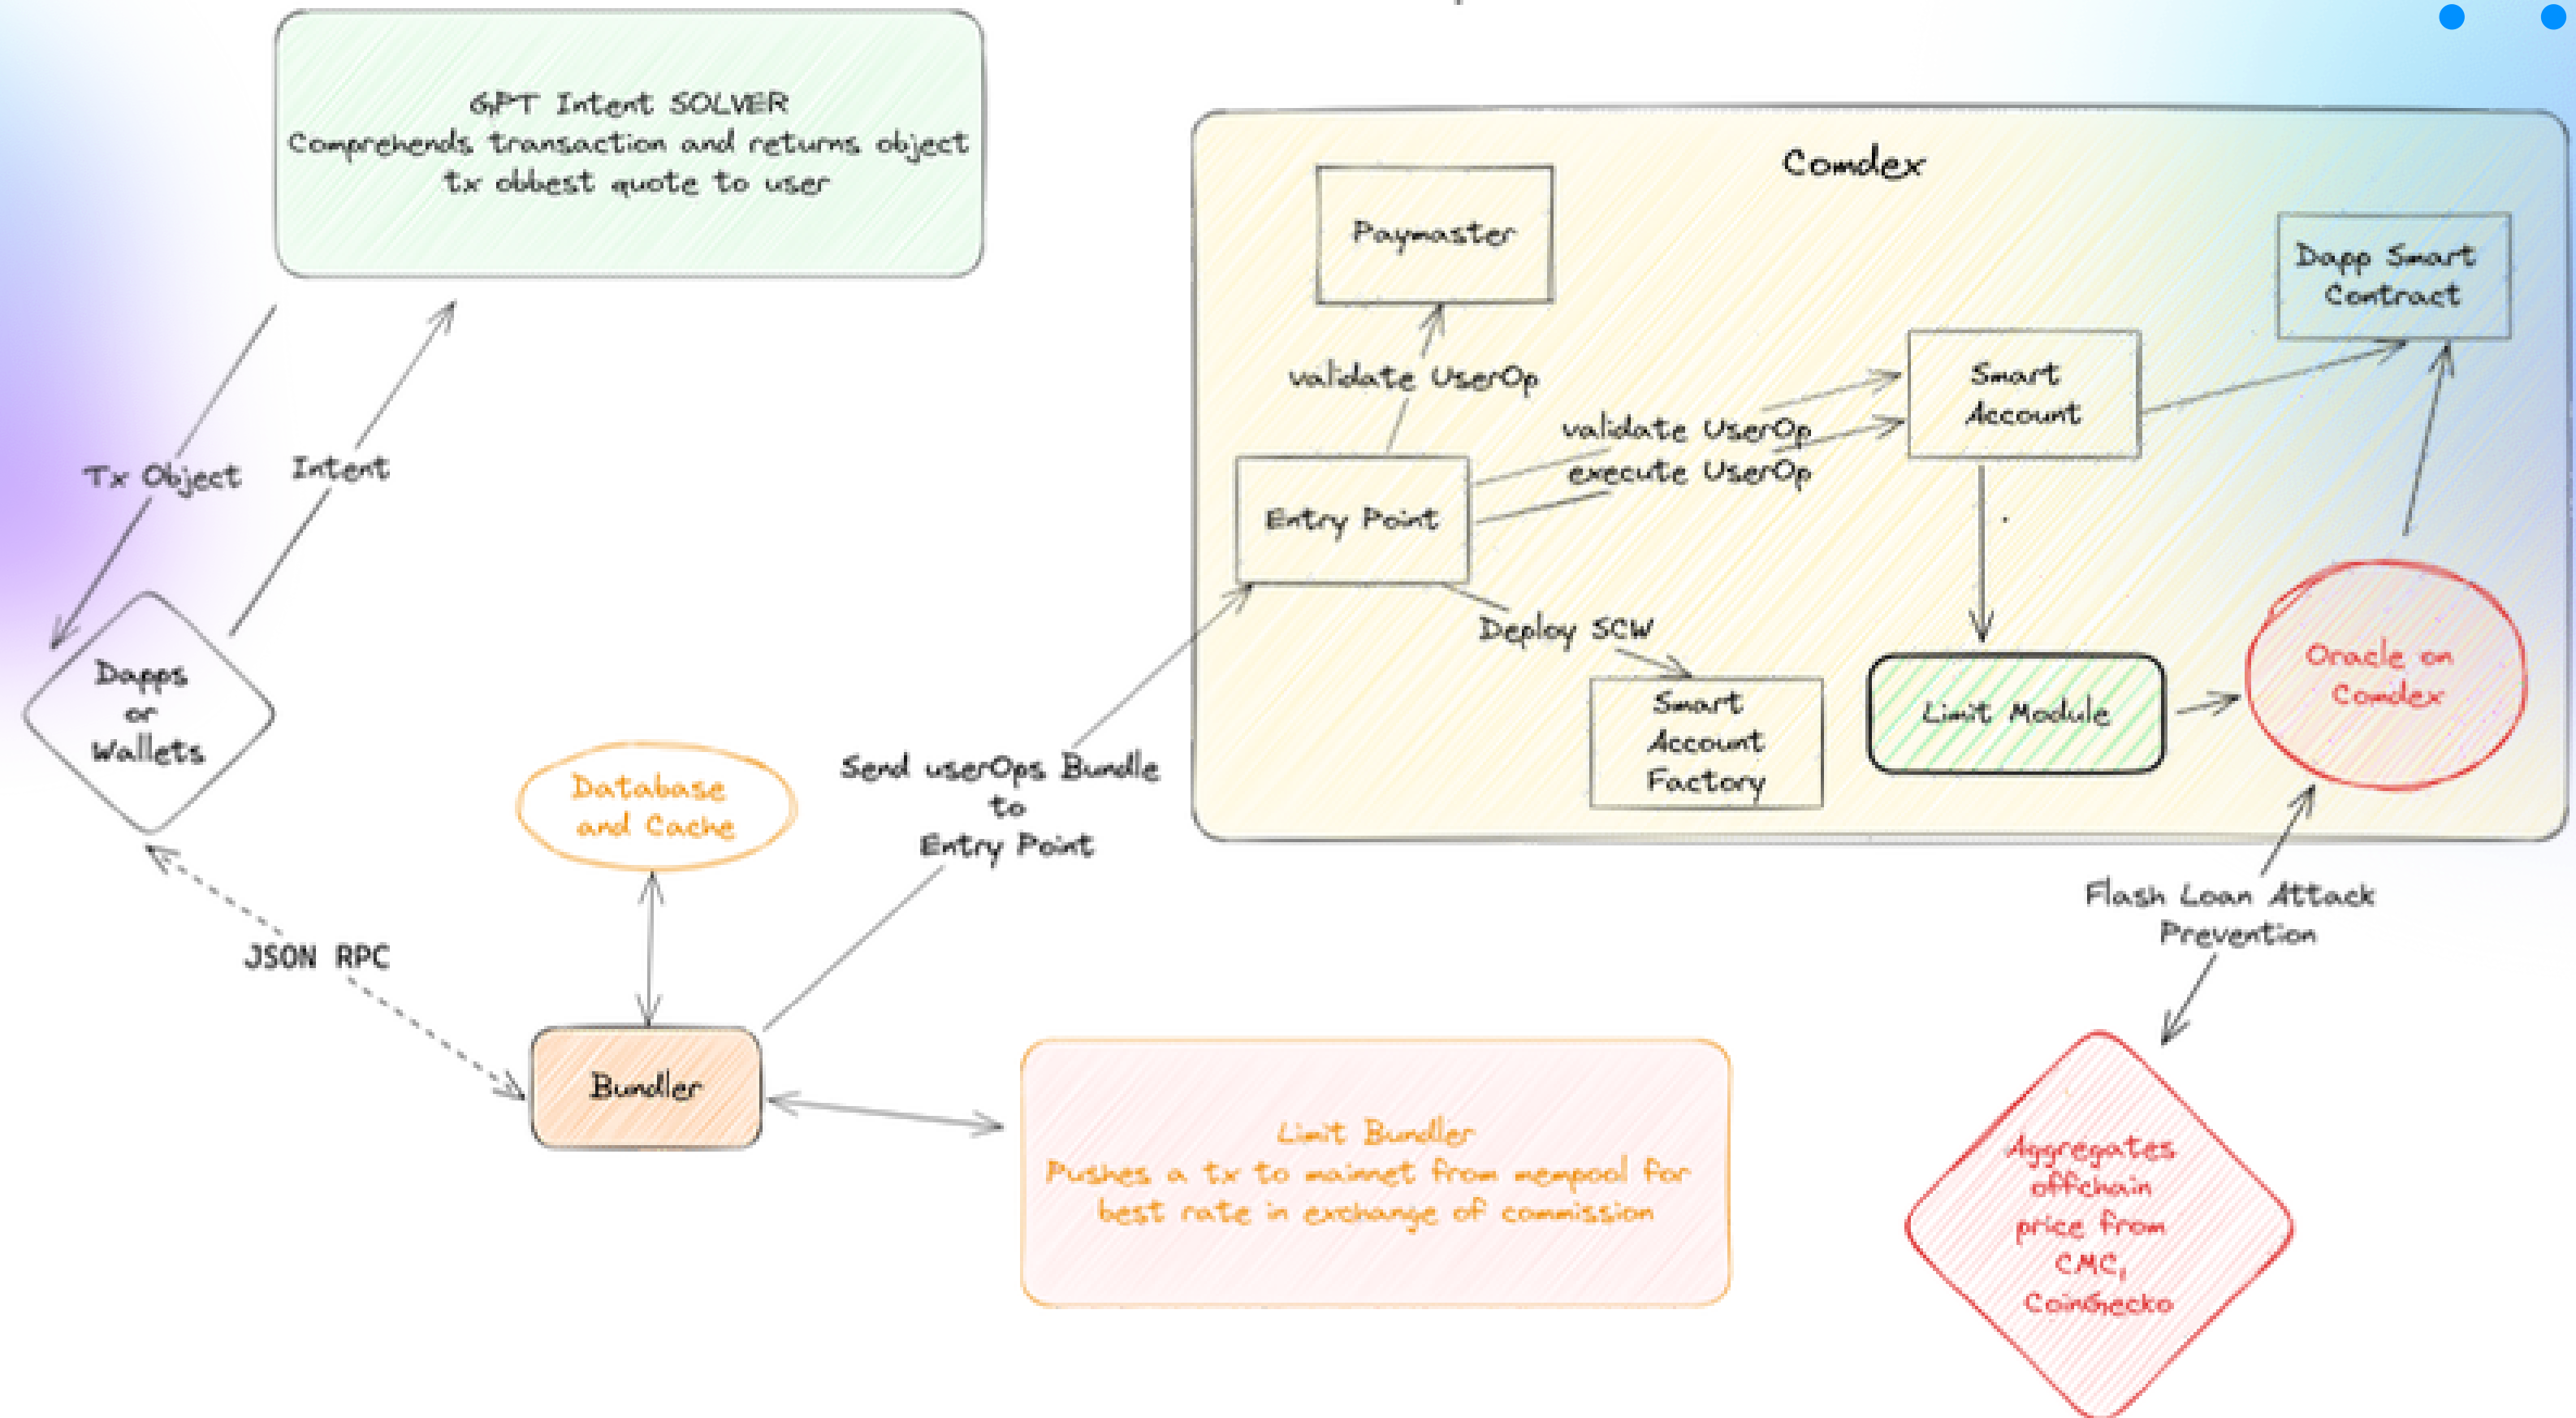

# The Solution

- Via account abstraction, go from complex, multi-step interactions to one-click experiences
- Easily batch multiple transactions, turning complicated user journeys on your dApp into a few clicks.
- Design user journeys easily with plug & play modules
- GPT solver to comprehend what the user wants to do from plain English.
- Limit Bundler to swap on behalf of users based on timeless/ timebound permissions

# Architecture

# More Modules

- Each module maker earns via premium gas fee
- Token paymaster for paying gas in different ERC20 tokens.
- Passkeys modules have same secp256r1 curve as Comdex. So people can use apple/android touch id, face id to generate, hold tokens and verify tx just by there devices.
- Marketplace for these modules.

# We're done!

THANK YOU. HAVE A  
GREAT DAY AHEAD.
